ABSTRACT

Plectranthus amboinicus (Lour) Spreng belongs to family Lamiaceae, known as country borage in English. It is large succulent aromatic perennial herb, shrubby below, hispidly villous or tomentose. It is found throughout India, Ceylon and Moluccas. The leaves of the plant are bitter, acrid and were being widely used traditionally for various purposes. The plant has been worked out very well and isolated several chemical constituents and had shown various biological properties. This review is an effort to compile all the information reported on its phytochemical and pharmacological activities. The present review is an attempt to generate interest among the masses regarding its immense potential in preventing and treating the several diseases.

Keywords: Plectranthus amboinicus, review, phytochemical, biological properties

INTRODUCTION

Allopathic treatment may either be permanent or temporary depending on the patient’s physical damage. Once the patient’s health has improved through nutritional methods, sometimes they can be weaned from the synthetic drugs\(^1\). Evaluation of Indian traditional medicine is possible through the proper exploitation and exploration of wide bio-diversity and great ancient treatises of traditional medicine with the light of modern tools and techniques\(^2\). Numerous medicinal plants and their formulation are used for disorders in the Ethno medical practices as well as traditional system of medicines in India. Potent activity and long term administration is required for the treatment of chronic diseases. Further, these drugs have various and severe
adverse effect. Therefore naturally originated agents with very little side effects are required to substitute chemical therapeutics. One of such herbal drug for chronic ailments is Plectranthus amboinicus Lour. which is widely used traditionally.

**Synonyms:**  
*Coleus amboinicus* Lour.

* Coleus aromatics* Benth.

**Family:** Lamiaceae

**Distribution**

This grassy plant is found or cultivated throughout India, Ceylon and Moluccas. Wild in Rajputana, also cultivated in gardens.

**MACROSCOPICAL FEATURES**

**Description**

A large succulent aromatic perennial herb, shrubby below, hispidly villous or tomentose.

Fig. 1
Fig 1 Twig and flowers of *Plectranthus amboinicus* Lour.

**Stem**

Stems are fleshy with 30-90 cm height.

**Leaves**

Leaves are 2.5-5 cm long, simple, opposite, petioled, broadly ovate or cordate, crenate, fleshy and very aromatic. Fig. 2

**Flowers**

Flowers are shortly pedicelled, 3 mm long, pale purplish in dense whorls at distant intervals in a long slender raceme. Upper calyx are lip ovate, acute, membranous, lower acuminate. Corolla are pale purplish, tube short, throat inflated, lips short. Stamens are shortly exserted.

**Fruits**

Fruits are orbicular or ovoid nutlets. Flowers and fruits during August-November.

**Parts Used**

Leaves.

**MEDICINAL USES**
The leaves are bitter, acrid, thermogenic, aromatic, anodyne, appetizing, digestive, carminative, stomachic, anthelmintic, constipating, deodorant, expectorant, lithontriptic, diuretic and liver tonic. They are useful in cephalalgia, otalgia, anorexia, dyspepsia, flatulence, colic, diarrhoea and cholera especially in children, halitosis, convulsions, epilepsy, cough, chronic asthma, hiccough, bochitis, renal and vesical calculi, strangury, hepatopathy, malarial fever, antispasmodic and cathartic. Juice of leaves mixed with sugar acts as a powerful aromatic carminative, given in colic and dyspepsia. Crushed leaves are used as a local application to the head in headache and to relieve the pain and irritation caused by stings of centipedes. Expressed juice is applied round the orbit to relieve the pain in conjunctivitis. In Malaysia, bruised leaves are applied to burns and their poultice on centipede and scorpion-bites. The leaf juice heals chapped lips and in java it is used to treat cracks at the corners of the mouth.

**CHEMICAL CONSTITUENTS**

Butylaniside, β-caryophyllene, carvacrol, 1-8-cineole, p-cymene, ethylsalicylate, eugenol, limonene, myrcene, α and β-pinenes, β-selenene, γ-terpinene, terpinen-4-ol, thymol, verbenone (essential oil), apigenin, chrysoeriol, 5,4-dihydroxy-6,7-dimethoxy-flavone (cirsimaritin), eriodictyol, 6-methoxy-genkawanin, luteolin, quercetin, salvigenin, taxifolin, oxaloacetic acid, crategolic, euscaphic, 2α-3α-dihydro-olean-12-en-28-oic, pomolic, oleanolic, tormentic, 2α,3α,19α,23-tetrahydroxyurs-12-en-28-oic, ursolic acids, β-sitosterol-β-D-glucoside isolated from the leaves.
morphological studies on the leaves of *Plectranthus amboinicus*\(^9\).

**PHYTOCHEMISTRY**

Brieskorn CH and Reidel W (1977) isolated eight triterpenic acids from the leaves of the South - American lamiaceae *Coleus amboinicus* Loureiro. 2,3-Dihydroxylean-12-en-28-oic acid, 2,3,19-trihydroxyurs-12-en-28-oic acid and 2,3,19,23-tetrahydroxyurs-12-en-28-oic acid were found first time in lamiaceae\(^1\)

Baslas RK and Kumar P (1981) reported that the oil obtained by steam distillation (0.04-0.05%), has been found to contain terpinolene (3.75%), α-pinene (3.20%), β-pinene (2.50%), β-caryophyllene (4.20%), methyl eugenol (2.10%), thymol (41.3%), 1,8-cineole (5.45%), eugenol (4.40%), carvacrol (13.25%) and β-phellandrene (1.90%)\(^1\). Bos R and Hendriks FH (1983) studied the composition of essential oil in the leaves of *Coleus aromaticus* Benthum and their importance as a component of species antiapthosae\(^1\). Malik MS *et al.*, (1985) studied on essential oil of the *Coleus aromaticus* plant\(^1\).

Haque IU (1988) detected fifteen components in the essential oil (0.1%) obtained from dry steam distillation of the fresh stalk and leaves of

**PHARMACOGNOSY**

Brindha P. *et al.*, (1991) presented the pharmacognostic, exomorphology, histomorphology and physico-chemical evaluation of the leaf and stem of *Coleus aromaticus*\(^9\). Kaliappan ND and Viswanathan PK *et al.*, (2008) carried out the micro
Coleus aromaticus. Thymol (79.6%) was shown to be the principal component of the oil\textsuperscript{15}. Pino J et al., (1989) investigated the essential oil of Coleus amboinicus Lour. by means of LSC, GLC and GC-MS and 20 components were identified, including 13 terpene hydrocarbons and 7 oxygenated compounds. The oils contained about 64% carvacrol\textsuperscript{16}. Pino JA et al., (1996) isolated volatile compounds from Coleus aromaticus leaf by steam distillation, hexane extraction and super critical CO\textsubscript{2} extraction and identified 26 components by GC/MS\textsuperscript{17}. Mallavarapu GR et al., (1999) analyzed the essential oils of Coleus aromaticus distilled in different seasons by capillary GC and GC/MS. The oils were found to contain carvacrol, p-cymene and gamma-terpinene as major constituents. The oil produced in September was found to contain higher contents of carvacrol and beta-caryophyllene and oxygenated constituents than the oil produced in May\textsuperscript{18}. Ragasa CY et al., (1999) reported that the air dried leaves of Coleus amboinicus afforded three flavones: salvigenin, crisimaritin and chrysoeriol by silica gel chromatography. There structures were elucidated by extensive 1D and 2D NMR and UV spectroscopy. Antimicrobial assay on salvigenin and crisimaritin showed low activities against the microorganisms tested\textsuperscript{19}. Singh G et al., (2002) investigated the leaf essential oil of Coleus aromaticus by GC and GC-MS techniques which indicated the presence of six components, accounting for 97 percent of the total oil\textsuperscript{20}. Kumaran A and Karunakaran RJ (2007) used an activity directed fractionation and purification process to identify the DPPH (1,1-diphenyl-2-picrylhydrazyl) free radical scavenging components of Coleus aromaticus Benth. Rosmarinic acid was found as a major component and principally responsible for the radical scavenging activity of Coleus aromaticus\textsuperscript{21}.

**PHARMACOLOGY**

Vera R et al., (1992) investigated essential oils of Plectranthus amboinicus by GLS & MS. Juice of its leaves is used for curing wounds and an infusion is said to possess anti-influenza properties\textsuperscript{22}. Baskar R et al., (1992) administered Coleus aromaticus leaf juice (at the rate of 1ml/rat/day) for 10-30 days in experimental urolithiatic rats. Reduction in the deposition of Ca and oxalate in the kidney tissue has been reported\textsuperscript{23}. Buzenego MT and Perez-
antioxidant activities of the ethanol extract of *Plectranthus amboinicus* at two dose 250 and 500 mg/kg bw on APAP-induced toxicity in rats\(^{37}\).

**MICROBIOLOGY**

Rao A *et al.*, (1991) reported that oil isolated from the leaves of *Coleus amboinicus* exhibited varying degree of antimicrobial activity against a number of pathogenic and non-pathogenic fungi and bacteria\(^{38}\). Prudent D *et al.*, (1995) analyzed the essential oil of *Coleus aromaticus* for its bacteriostatic and fungistatic properties\(^{39}\). Ruiz AR *et al.*, (1996) carried out a screening for genotoxic activity in aqueous or alcoholic extracts from 13 medicinal plants used as folk medicine in Cuba along with *Plectranthus amboinicus*\(^{40}\). Deena MJ *et al.*, (2002) reported antimicrobial screening of essential oils of *Coleus aromaticus* and *Coleus zeyla*\(^{41}\). Perumal G *et al.*, (2004) tested ethanolic extract of nine medicinal plants parts along with *Coleus aromaticus* (leaves) for antifungal activity against *Aspergillus flavus*, *A. terreus* and Mucor species. The extract in different concentrations exhibited good fungicidal activity\(^{42}\). Uawonggul N *et al.*, (2006) screened the aqueous extracts of 64 plant species along with *Plectranthus amboinicus* for their activity against fibroblast cell lysis after *Heterometrus laoticus* scorpion venom treatment\(^{43}\). Murthy PS *et al.*, (2009) investigated *Plectranthus amboinicus* for antifungal activity through agar well diffusion assay\(^{44}\).

**TOXICITY STUDIES**

Parra AL *et al.*, (2001) determined the median lethal concentrations (LD50 value) of 20 plant extracts along with *Plectranthus amboinicus* using *Artemia salina* (tested at three concentrations: 10, 100 and 1000 µg/ml for each extract). Good correlation was found between in vivo and in vitro test (\(r = 0.85, P<0.05\))\(^{45}\). Jose MA *et al.*, (2005) have done the LD50 using OECD guideline for testing of chemicals revised draft guideline 423. The one tenth of the LD50 500mg/kg was chosen as a dose for the further study. The urine and histopathological results clearly revealed the antilithiotic activity of *Plectranthus amboinicus* particularly of calcium oxalate origin\(^{46}\).

**MISCELLANEOUS STUDIES**

CONCLUSION

Considering the easy availability of Plectranthus amboinicus in our country and leaves of the plant possess a wide range of biological properties, it seems that still there is a scope for scientific studies to fully exploit its medicinal properties to support traditional claims as well as, exploring some new and promising leads. The pharmacological studies so far have mostly been performed for volatile principle of plant. In future study, the isolated principle of extracts of Plectranthus amboinicus needs to be evaluated in scientific manner. It could be concluded that P. amboinicus is a rich source of compounds, interesting chemical structures and various biological active products.
